Experience

Serokell

August 2020 – Present

Haskell Software Engineer

- Improved the optimizer of smart contract's code in [Morley](#): fixed the former's independency of contract's instruction parse tree by researching the optimizer's associativity; added several-staged optimizing.
- Worked on Morley internal development: increased type safety, improved parser, unified usages of unsafe methods.
- Developed VS Code extension feature: implemented frontend and backend components for handling lambda functions in [Michelson Debugger](#).
- Improved networks config updating: added web scraping Python script to a project's CI.
- Added feature to ignore external references in markdowns to [Xrefcheck](#) repository documentation verifier.
- Wrote educational articles for the blog about base Haskell typeclasses, e.g. [Foldable](#) and [Functor](#).

ITMO University, Computer Technologies Department

Autumn 2020

Teaching assistant of Functional Programming course

Saint Petersburg, Russia

- Reviewed students' homeworks.

Projects

[Algorithmic Transparency on Search Engines Research](#) | *Python, Selenium, Nginx, R* January 2021 – June 2021

- Devised monitoring system in keeping with adversarial perception principle, that interfaces with ten search engines; performs web scraping with Selenium WebDriver and Python; collects robots' data by logging Nginx.
- Analysed collected robots' records: confirmed drawn conclusions with exterior knowledge; compared the search engines' page ranking algorithms with known ones.
- Represented collected data with descriptive plots using R.

[Linear Programming Solver](#) | *Python, NumPy*

April 2021

- Implemented Simplex Method to solve the Linear Programming Problem, utilizing NumPy for linear algebra operations.
- Added CLI to control parameters of the problem.

[Parser Generator](#) | *Haskell, Alex, Happy*

February 2020

- Developed program, that takes the definition of language tokens and rules of LL(1) grammar and generates matching parser.

Education

ITMO University, Computer Technologies Department

September 2017 – June 2021

Bachelor

Saint Petersburg, Russia

Technical Skills

Languages: Haskell (industry); Python (solid); C++, Java, Go, Typescript (basic)

Technologies: Linux, Git (solid); Selenium WebDriver, Nginx (basic)

Other Skills: Algorithms and Data Structures, Functional Programming, Parsing Methods (solid); Cryptography, Reverse Engineering with IDA, Databases Management Systems, Parallel Programming, Machine Learning (basic).

Extracurricular

Haskell eXchange 2022: In-Person Conference

December 2022

Speaker

London, UK

- Talked about "[How to Choose a Haskell Web Framework](#)" – overview and comparison of Haskell web tools (Servant, Yesod, IHP) from the beginner's point of view, using simple TODO-list application with custom logger middleware as an example.

VK Hackathon

September 2019

Participant

Saint Petersburg, Russia

- Worked in the team of four, primarily developed website design.
